Phoca Download: Invalid argument supplied for each

Posted by azurelink - 2015/07/10 19:38

HI Edwin,

I am running 1.3.47 Full on Joomla 3.4.3 and I've just imported a slave site and have upgraded Phoca Download to version 3.0.6.

I also ran the database fix, so the tables are up to date.

When I visit the front end, I can access and download the Phoca files.

But when I click on Components/Phoca Download/Files in the admin area, the page does not list the files and I get the following error message:

Warning: Invalid argument supplied for foreach() in /home/myaccount/domains/parentsite.com/subdomains/parentsite_dir/public_html/administrator/components/com_phocadownload/views/phocadownloadfiles/view.html.php on line 28

Count of not authorized file(s): 177

If I click on Components/Phoca Download/Files in the parent site, I do not get the error message.

Do you have any idea how I can solve this problem so that I can see the list of files?

I'm also waiting for replies to a forum post I made in the Phoca Download support forum.

Thanks!Inva

We have added the definition of the Phoca Download that will be available in the JMS version 1.3.51
