Fatal error

Posted by ChristerE - 2016/04/01 16:45

Hi, I'm using 1.3.58 - basic
Master site: http://www.mettecosmetique.se
Slave site (1 of 7): http://nimue.se/

I've recently upgraded my Joomla to 3.5.0 and on all my slave-sites,
I've run "Fix database", cleared all cache and purged all converted file but still I get:
Fatal error: Cannot redeclare contentBuildRoute() (previously declared in /home/mettecos/public_html/components/com_content/router.php:483) in /home/mettecos/public_html/components/com_multisitescontent/multisites.router.php on line 496

Anyone?

I've solved it (panic solution) by commenting out the following in /components/com_multisitescontent/multisites.router.php:

```
/**
 * Content router functions
 *
 * These functions are proxys for the new router interface
 * for old SEF extensions.
 *
 * @param   array  &$query  An array of URL arguments
 *
 * @return  array  The URL arguments to use to assemble the subsequent URL.
 *
 * @deprecated  4.0  Use Class based routers instead

function contentBuildRoute(&$query)
{
 $router = new MultisitesContentRouter;

 return $router->build($query, $site_id);
}
```

```
*/
/**
 * Parse the segments of a URL.
 *
 * This function is a proxy for the new router interface
 * for old SEF extensions.
 *
 * @param    array  $segments  The segments of the URL to parse.
 *
 * @return  array  The URL attributes to be used by the application.
 *
 * @since   3.3
 * @deprecated  4.0  Use Class based routers instead

function contentParseRoute($segments)
{
 $router = new MultisitesContentRouter;

 return $router->parse($segments, $site_id);
}
*/
```

I know this source, but the problem does NOT comes from there but from the core of joomla that is perhaps changed and cause an incompatibility issue.
So I need to be able reproducing it with a debugger to understand what in the core of joomla cause that.

Yes, I understand that, like I wrote it was just a quick fix (perhaps can help someone else in the same situation) :)
Will you post in this thread when you find the solution or should I keep my eyes open for an update?

Becarefull that the file "multisites.xxx" are removed when you do "purge".
So your "panic fix" can be removed at any time.

I have noticed the problem and started to prepare an environment to reproduce it.
This may take a little time.
Thank you to have reported this issue.

Can you precise the version of the "Article Sharing" that you are using ?
Do you use the latest version "1.3.07" ?
Can you also precise which were the previous version of Joomla ?

In case where you would need to get the latest version, see the FAQ for the procedure
https://www.jms2win.com/en/faq/faq-joomla-multi-sites#cat-122

JMS MultiSite version: 1.3.58 - basic
Article Sharing version: 1.3.04
Previous Joomla version: 3.4.8

This is strange that you mentioned Article Sharing 1.3.04 with J3.4.8.

The reason is that you should have to use the Article Sharing 1.3.05 with J3.4.8 and that we add fixed the issue that you have reported in Article Sharing 1.3.05.
So we don't know why it would had worked in J3.4.8.

Do the update of the article sharing that should fix the issue that you reported in J3.5.0 as theorically, this is the one published in the Article Sharing 1.3.05 that should fix this issue.

Hi, great news!
I've updated to JMS MultiSite version: 1.3.59 BASIC, checked and fixed patches, installed Multi Sites Articles sharing 1.3.07, purged all converted files.
Now everything is working perfectly without my quickfix :)
THANKS for very good support!
