Login code coming from different domain

Posted by pixelgeek - 2013/02/07 19:28

I have two sites set up in JMS

arcanewonders.com
magewars.com

there is a master site called

master.magewars.com

All of the login.php and logout.php code is being served from arcanewonders.com

So if I am on the magwars.com website (either logged in or logged out) the code is being served from the arcane wonders.com domain

This is causing some serious speed issues on our site

Does anyone know why this code is always coming from the arcanewonders.com domain and not the magewars.com domain and how to fix it so this doesn't happen?

Thanks

An update.

The issue appears to be the script tag inserted my the plugin. It points to the wrong domain. So at magewars.com the script src is

when it should be

I have looked pretty much everywhere in the settings for the site and the master and can't see where this source domain is specified.

The list of domain where the plugin send the "ping" is either defined automatically or you can force specific value yourself when you select specific domains.

So if you don't want that the "ping" is sent to
www.arcanewonders.com
but on
www.magewars.com

You can change the setup of the plugin to provide a specific list of domains.

When you use the automatic domain computation, the plugin use the definition present in JMS to compute the domains where must be sent the "ping".
This is based on the shared user definition that you have setup when building the slave site.

Go in the plugin / system / SSI for domain and update the setting to provide a specific list of domains.
