

Trouble with JMS basic 1.3.33

Posted by score42 - 2014/05/24 03:21

Hi guys,

I'm newbie of JMS multisite component. I try to install it on a fresh Joomla installation with french translation.

I tried with:

- Joomla 3.3.0
- Joomla 3.2.X
- Joomla 2.5.20

In all cases the installation work but I can't get the multisite work...

Environment:

- PHP 5.3.10
- CP: ISPCONFIG3
- OS: GNU/Linux Ubuntu
- PHP wrapper: PHP-FPM

The workflow:

- fresh installation of Joomla
- rename installation directory to installation.msites
- go to administrator aera
- install of com_multisites_V1.3.33_basic.zip component
- after installation complete go to checkpatches

in the task I see everything in red except: administrator/components/com_multisites/multisites.xml

When I try to apply the patches (click on Install) I got an alert:

JFolder::create: Infinity loop detected

Unable to create destination

Error during the installation of "administrator/defines.php"

Of course I tried to put everything in 777 but the trouble remain !

Do you have an idea of what could be wrong ?

Regards,

Renaud

The error message is a problem of permission.

When you have an infinite loop, this is generally due to the fact that Joomla can not create a directory and it loop in trying to create a directory.

You can sometimes bypass the problem of permission, when using the FTP Layer that you can define in the "global configuration".

Ensure that the FTP user is the same as the files and folders owner present in your website.

Which kind of server administration do you use ?

Such kind of problem is frequently encountered with "Direct Admin" and with some old "Plesk".

You need to verify the ownership of the files and folders and now if your apache runs with the owner of the file or use a static name like "apache" owner.

When the suPHP module is present in apache, it should use the owner of the file that is executed but in your case, this does not seem to be the case.

Hi Edwin,

Please find below my replies to each question

edwin2win wrote:

Ensure that the FTP user is the same as the files and folders owner present in your website.

I tried this option but nothing more changed.

Below the extract of the FTP sessions:

```

10.12.11.125 - c1_XXXXXX "PUT
/var/www/clients/client1/web61/web/libraries/joomla/session/session.php" 200 21614
10.12.11.125 - c1_XXXXXX "PUT /var/www/clients/client1/web61/web/libraries/joomla/user/user.php" 200 18873
10.12.11.125 - c1_XXXXXX "PUT /var/www/clients/client1/web61/web/libraries/legacy/view/legacy.php" 200 19085
10.12.11.125 - c1_XXXXXX "PUT
/var/www/clients/client1/web61/web/components/com_content/helpers/route.php" 200 5140
10.12.11.125 - c1_XXXXXX "PUT
/var/www/clients/client1/web61/web/components/com_content/models/articles.php" 200 20965
```

As you can see all FTP interaction got an "200" as reply which means that everything was fine.

The user use "c1_XXXXXX" have the read/write abilities over the whole
"/var/www/clients/client1/web61/web" directory and sub-directories. The Apache user as well.

Which kind of server administration do you use ?

Such kind of problem is frequently encounter with "Direct Admin" and with some old "Plesk".

As described in my original post I use ISPCONFIG3. Which is an opensource panel. I'm an experimented sysadmin (I owned the whole hosting infrastructure) and I use this panel just for convenience. I know that this panel use special unix flag (immutable) in the root directory `/var/www/clients/client1/web61/"` to prevent some kind of hacks. But your module shouldn't go before `/var/www/clients/client1/web61/web` which is the public web root directory (equivalent to `public_html` for some panels).

You need to verify the ownership of the files and folders and now if your apache run with the owner of the file or use a static name like "apache" owner.

when the suPHP module is present in apache, it should use the owner of the file that is executed but in your case, this does not seems the case.

The apache user and the ftp user execute the PHP operation under the local userid (unix). I'll send you in PM the URL to test the `phpinfo()` and see by yourself.

I look inside the error.log and I see nothing about the folder/file creation failure.

I enabled the maximum verbose message in Joomla but we didn't see more information. The only thing happened (before we try to apply patches) is this message:

Strict Standards: Only variables should be assigned by reference in
/var/www/clients/client1/web61/web/administrator/components/com_multisites/controllers/patches.php
on line 33 Strict Standards: Only variables should be assigned by reference in
/var/www/clients/client1/web61/web/administrator/components/com_multisites/controllers/patches.php
on line 34 Strict Standards: Only variables should be assigned by reference in
/var/www/clients/client1/web61/web/administrator/components/com_multisites/controllers/patches.php
on line 40 Strict Standards: Only variables should be assigned by reference in

on line 45 Strict Standards: Non-static method MultisitesController::_getVersion() should not be called
statically in
/var/www/clients/client1/web61/web/administrator/components/com_multisites/patches/joomla/check_jm
s_vers.php on line 31 Strict Standards: Non-static method
Edwin2WinModelRegistration::getLatestVersion() should not be called statically in
/var/www/clients/client1/web61/web/administrator/components/com_multisites/models/patches.php on
line 239 Strict Standards: Only variables should be assigned by reference in
/var/www/clients/client1/web61/web/administrator/components/com_multisites/views/patches/view.php
on line 46 Strict Standards: Non-static method MultisitesController::_getVersion() should not be called
statically in
/var/www/clients/client1/web61/web/administrator/components/com_multisites/patches/joomla/check_jm
s_vers.php on line 3

For you information these tests were made with Joomla 3.3.0 (final release).

Thanks for your support,
Renaud

To find the effective file or folder that cause the problem of permission, there is no other solution than add debugging things inside the Joomla core to get the name of the file (or folder) that can not be update or installed.

The PHP Strict that you get when providing more error reporting is not a fatal error and does not provide any information on the file or folder that forbid to be processed.

The "inifinite loop" message is generated inside the source /libraries/joomla/filesystem/folder.php

Oki I've apparently fix the issue (in Joomla 3.3.1 at least) by according an open_base directive on "/" path....

Why do you need to have access to the root path ?

Regards,
Renaud

Re: Trouble with JMS basic 1.3.33

Posted by edwin2win - 2014/06/15 21:35

We don't need to access the root directory.

Perhaps that you have setup something that require to go in the root directory.

Perhaps a "tmp" directory that you have setup to go in the root like "/tmp" or any other things

If you ask that, I suppose that you know the path that cause the problem and to help me understand your remark, please provide the value of the path to understand what is tried to be accessed in the root path.

Posted by iage - 2015/03/18 09:54

I had the same issue on a server with Plesk 12.

I changed the open_basedir to 'none' at was then able to install the patches.

Kind regards

-Stephan

We don't need to access the root path of your server but if you have setup an open_basedir, you have to provide the permission to access the slave site directories and also the master directories.

So you may potentially have to put several path in your open_basedir to give the access to the master and the slave site.

Otherwise, effectivelly the "infinite loop" can occurs inside Joomla when a directory can not be created.

The fact to put the "/" in the open_basedir is equivalent to disable it.
