When deleteing slave don't delete it's directory

Posted by djdesjardins - 2012/02/20 21:46

This would be more useful from back end. Would like the ability to "NOT" delete the deployed directory when you delete the slave site.

In normal production operations I can see this as not being a big issue, but when you are doing extensive integration testing, having to recreate the folders (regardless of how) can slow you down and add potential errors, particularly if you are also testing dns mappings.

In test development, you don't need to recreate the directory as you can just click in the JMS template rule to ask JMS create the directory when it does not exists.

So just click on the check box to let JMS build the directory when it is not present.
