DB Error

Posted by bristweb - 2009/01/26 22:20

---

ok heres what happened

set table prefix to:
{site_id}_

then created a new site with site id: n-1

this created a ton of database errors

possible solutions:

correct any data that will be used as a prefix and check for duplicates in the database
javascript notice if the prefix will cause error. (even if using {variable})

==========

Can you give screenshoot and a complete reproducable scenario.

I am not able to reproduce the problem you have described.

I have created a new slave site with JSm Site manager and I have put site ID = t01, selected a template with an existing website and set the "new table prefix" = {site_id}_.
The result has been the replication of the website selected in the template with a new table prefix 't01_' as expected.
