I try to install a multisite with GMACCESS present

Posted by patman37 - 2009/02/07 19:24

_____

Hello,

Here is my problem.
I try to install a multisite with GMACCESS present on it. After installing a slave sites I no longer have access to anything, neither master nor slave nor front or back ... ,
so I uninstall by following all procedures in the manual "in the basics. I find my access to the site master and slaves.
Then I began to start the install by the site owner. The less than pb, front access and back to master, and nothing about the slaves, I made a copy of bases gmaccess and I had to recreate an identical copy and in the bases of slaves and the sites I I recover access to the admin page to log the following message "Fatal error: Undefined class name 'fonctiongmaccess' in .... / plugins / user / joomla.php on line 109 in admin on the slaves.
And the message "Fatal error: Undefined class name 'fonctiongmaccess' in .... / application / menu.php on line 279 in the client on the slaves.
Is there a special procedure for this type of install?
Qqun a reussi there to do?
The module "Gmaccess" is absolutely fantastic and really well designed and developed, and for this reason that I would succeed this install.

Thank you in advance for your help, and even hats for the product.

_____

I have tried to reproduced the problem you have described without success.
Can you give a detailled scenario on how to reproduce this problem.

All I have seen is that GMAccess require the Joomla French language is present - Otherwise it is not allowed GMAccess.
I have also seen that GMAccess replace a lot of Joomla files.
When I have re-login Joomla, I have checked in JMS has no files to patch.
So JMS and GMAccess does not patch the same files.

I have also created a slave site and I don't had problems.

So give a detail scenario that describe the order you proceed with the installation, what are the setup value used, ...
Have you used a French Joomla distribution or an English Joomla distribution where you add the french language, ... which version (have you used ?) Joomla 1.5.9 ? Which platform, ...
