Duplicate Admin Main Menu in slave site

Posted by kenlyle - 2009/03/17 00:16

The master site is a clone of a production site, has many components running, some of which are not officially supported.

The Admin on my master site looks fine, but the one on the slave site is basically doubled, see attachment, and when any of the major icons on the control panel is clicked, I get:

Fatal error: Cannot redeclare class JAdminSubMenu in /home2/blah/public_html/site15master/administrator/modules/mod_submenu/mod_submenu.php on line 32

I am removing components to try to eliminate the issue, and will report back.

Best,
Ken

The Media Manager menus are doubled, too.

Image unreadable.
Can you provide a bigger screenshot.

Without debugiing on your specific environment, I don't know.
If you want that we assist you to debug on your environment, this will be a billable support that you can order on our website.
